Given a matrix $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$, recall that one can calculate its eigenvalues by solving the characteristic polynomial $\lambda^2 - (a + d)\lambda + (ad - bc) = 0$. In this quiz, you will practice calculating and solving the characteristic polynomial to find the eigenvalues of simple matrices.

For the matrix $A = \begin{bmatrix} 1 & 0 \\ 0 & 2 \end{bmatrix}$, what is the characteristic polynomial, and the solutions to the characteristic polynomial?

☐ $\lambda^2 - 3\lambda - 2 = 0$

$\lambda_1 = 1, \lambda_2 = -2$

☐ $\lambda^2 + 3\lambda - 2 = 0$

$\lambda_1 = -1, \lambda_2 = 2$

☒ $\lambda^2 - 3\lambda + 2 = 0$

$\lambda_1 = 1, \lambda_2 = 2$

Correct

Well done! This matrix has two distinct eigenvalues.

☐ $\lambda^2 + 3\lambda + 2 = 0$

$\lambda_1 = -1, \lambda_2 = -2$

2. Recall that for a matrix A , the eigenvectors of the matrix are vectors for which applying the matrix transformation is the same as scaling by some constant.

For $A = \begin{bmatrix} 1 & 0 \\ 0 & 2 \end{bmatrix}$ as immediately above, select all eigenvectors of this matrix.

☐

$$\begin{bmatrix} 1 \\ -1 \end{bmatrix}$$

Un-selected is correct

☐

$$\begin{bmatrix} 0 \\ 2 \end{bmatrix}$$

Correct

Well done! Recall that if a vector is an eigenvector of a matrix, then so is any (non-zero) multiple of that vector.

☐

$$\begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

Correct

Well done! One way to check that a vector is an eigenvector is to simply apply the matrix transformation and see if this is the same as multiplying by a scalar. Another way is to calculate the eigenvector by hand, as in the lecture videos.

☐

$$\begin{bmatrix} 0 \\ 3 \end{bmatrix}$$

Correct
